

ABSTRACT OF THE DISCLOSURE

Search results and information found at an information source are transferred to a repository, such as an information depot, which is accessible by a number of means, including telephone and Internet. Data identifying a user are maintained at the repository. Information is
5 received from the information source where it is associated with the identifying data. The information is then stored at the repository and released to selected recipients based on instructions from the user that include the identifying data. The repository may be accessed through an information assistance service. The identifying data are used to recognize the user when the user accesses the information at the repository. Recognition may be performed, e.g.,
10 using automatic number identification (ANI) or a user voiceprint.
